

SAY THIS FIRST

**Google Maps tells you
how to get there.
VII**B**E tells you if it's
worth going.**

A live map of crowd energy, read by the people actually in the room. Lagos first.

Never mix these up

The story stopped landing because all three were said at once. Pick by who is in front of you.

TO A PERSON

"You know how Maps shows red where there's traffic? We do that for where people gather."

Never say: sensor network, energy layer, intel market.

TO A VENUE OWNER

"Did your last big night actually fill the room? We can show you, in naira."

Never say: scouts, clout, anything about the consumer game.

TO AN INVESTOR

"Traffic data made Maps indispensable. Nobody has that data for human gatherings. We're building it."

Never say: nightlife app. That is a category graveyard.

What VIIBE actually is

Scouts inside a venue confirm what the room feels like right now, in three seconds. Readings **decay in minutes**, because energy does. The result is a live city map where every gathering glows by how alive it is: white hot for packed, grey for dead.

Consumers stop guessing where to go. **Venues pay for the truth about their own rooms**. Machines query the same feed, which is how VIIBE becomes the layer assistants answer "where's good tonight" from.

Nightlife in Lagos is market one, not the identity. The engine does not know what a nightclub is. Concerts, festivals and street events are configuration, not rebuilds.

THE SPINE

LAYER	QUESTION
1. SENSE input	Is this real? Geofence, credibility weights, decay, anti-fake gates
2. READ product	Where should I go? The map, venue detail, peak countdown, Big Screen
3. SELL revenue	What is it worth? Venue dashboard, watchers, Lift Report, agent API

If a feature does not fit a layer, it does not ship. This is also the build order and the pitch order.

Four tiers, in order

Ordered by what earns soonest and holds up best. The consumer app is **not** the business; it is how the data gets collected.

TIER	WHEN	SIZE
1. Venue SaaS	Now, no scale needed	₦500k/mo at 20 venues
2. Lagos plays	3 to 12 months	₦1M to 3M/mo
3. Brands	6 to 18 months	₦2M to 5M per deal
4. Exit assets	Year 2+	The multiple

The rule that protects all of it

Money buys **placement and visibility, never the score**. The day the number can be bought is the day nobody pays for the data. Sponsored slots, badges, bigger pins: yes. A higher energy reading: never.

Revenue that needs no scale

All three work with a handful of scouts and one venue. Rails already built.

VENUE INTELLIGENCE SUBSCRIPTION

The truth about their own room

Live energy, watchers in orbit, weekly Lift Report, district benchmark. Recurring, and it never touches the public signal.

₦25,000 to ₦50,000 per venue / month

THE LIFT REPORT · THE WEDGE

"Did the ₦500k DJ pay for itself?"

The most expensive unanswered question in Lagos nightlife. Nobody can answer it. You can. This gets the meeting; the subscription is what you sell in it.

Free pilot, then converts to subscription

VIIBE CERTIFIED BADGE

Credibility they cannot fake

Venues live on Instagram credibility. A third-party verified "consistently high energy" badge is something they can post and rivals cannot buy. Already computed in the engine. Near pure margin.

₦15,000 per month, per venue

THE FIRST ₦ , STEP BY STEP

- > Two venues on a **free pilot**, Fridays only.
- > Send a Lift Report every Monday morning, without fail.
- > Week four: "this is what it showed. It is ₦25k a month to keep it."
- > One paid invoice is the milestone, not the amount. **The receipt is the proof.**

Things only you can sell

These use data you already collect and nobody else has.

PRE-ARRIVAL OPS FEED

"38 people are on their way"

You already capture "I Dey Road" intent. Tell a venue who is en route **before they arrive**: staff up, open the second bar, brief the door. No competitor has forward-looking demand.

₦15,000/mo add-on

PROMOTER SCORECARD

A credit score for the people who move Lagos

Promoters claim they fill rooms. Nobody verifies. You can measure whether energy actually lifted on their nights. Sell verified ratings to the venues who hire them, and a Verified badge to the promoters who deliver. Two-sided.

₦10,000/mo promoter · bundled for venues

SPONSORED REWARD POOLS

Brand money that does not corrupt the score

Pool funding already exists for merchants. Let brands fund it: "Guinness is paying double clout at these five venues tonight." Advertising that **creates** real scouting instead of faking it.

₦250,000+ per campaign night

BIG SCREEN SPONSORSHIP

The wall becomes inventory

Venues project VIIBE. A brand sponsors the frame around the number, never the number itself.

₦100,000+ per venue / month

DJ AND TALENT PERFORMANCE

Which names actually lift a room

Same logic as promoters, applied to talent. Venues pay to book right instead of by reputation. DJs pay for verified proof they deliver.

Bundled with venue subscription

Where the real naira is

BRAND ACTIVATION INTELLIGENCE Targeting, then proof Guinness, Heineken, Trophy, Hennessy and their agencies spend heavily on Lagos nightlife with no targeting data and no verification. Sell both: where to activate this Friday, and whether last week's activation actually lifted the room. ₦2M to ₦5M per agency deal	
DETTY DECEMBER PACKAGE The one month with hard currency Mid-December to early January, the diaspora returns with money and zero local knowledge. Highest willingness to pay in the year, on both sides: a premium concierge tier for returnees, and December activation intelligence sold to brands at peak rates. Time-boxed, high margin, annual. Premium seasonal pricing	
SITE SELECTION REPORTS "Where should the next lounge open?" Footfall and energy heatmaps sold to developers and investors opening venues. One report, one invoice. ₦1M to ₦5M per report	
TABLE BOOKING COMMISSION Paid rail already live Lagos tables run ₦100k to ₦2M. Booking flow and Paystack are built. Commission on high-intent bookings the map itself created. 5 to 10 percent per booking	

What an acquirer buys

- > **The assistant layer.** When someone asks Siri, ChatGPT, Claude or Gemini "where's good tonight", the answer has to come from somewhere. The agent API and MCP server are live today.
- > **Movement and taste data.** Who goes where, with whom, at what hour, across a whole city.
- > **Ride demand.** Uber and Bolt want to know where crowds will be at 2am before they are.
- > **The category position.** Nobody owns live human energy data in Africa. That is the thing being bought.

THE LINE THAT PROTECTS EVERY LINE ABOVE

THE SCORE CANNOT BE BOUGHT

Paid promotion buys reach, position and a **SPONSORED** badge. It does not touch the energy number. This is enforced in the engine and guarded by a test that fails if anyone re-adds it.

Say this out loud in every venue and brand meeting. It is the reason the data is worth paying for: **nobody licenses crowd data that rivals can purchase their way up.**

THE PROMISE THAT MAKES IT WORTH BUYING

We would rather show you **nothing** than lie to you.

Readings expire. Remote taps are damped. Peak status needs corroboration and a sustained hold. A quiet map is allowed to look quiet.

This is not modesty. It is the moat. The day the signal can be faked, every revenue line above dies at once.

THE TEST

You have the pitch when a stranger repeats it back after hearing it once:

"It's traffic, but for parties."

When they say that, stop explaining and start selling.
